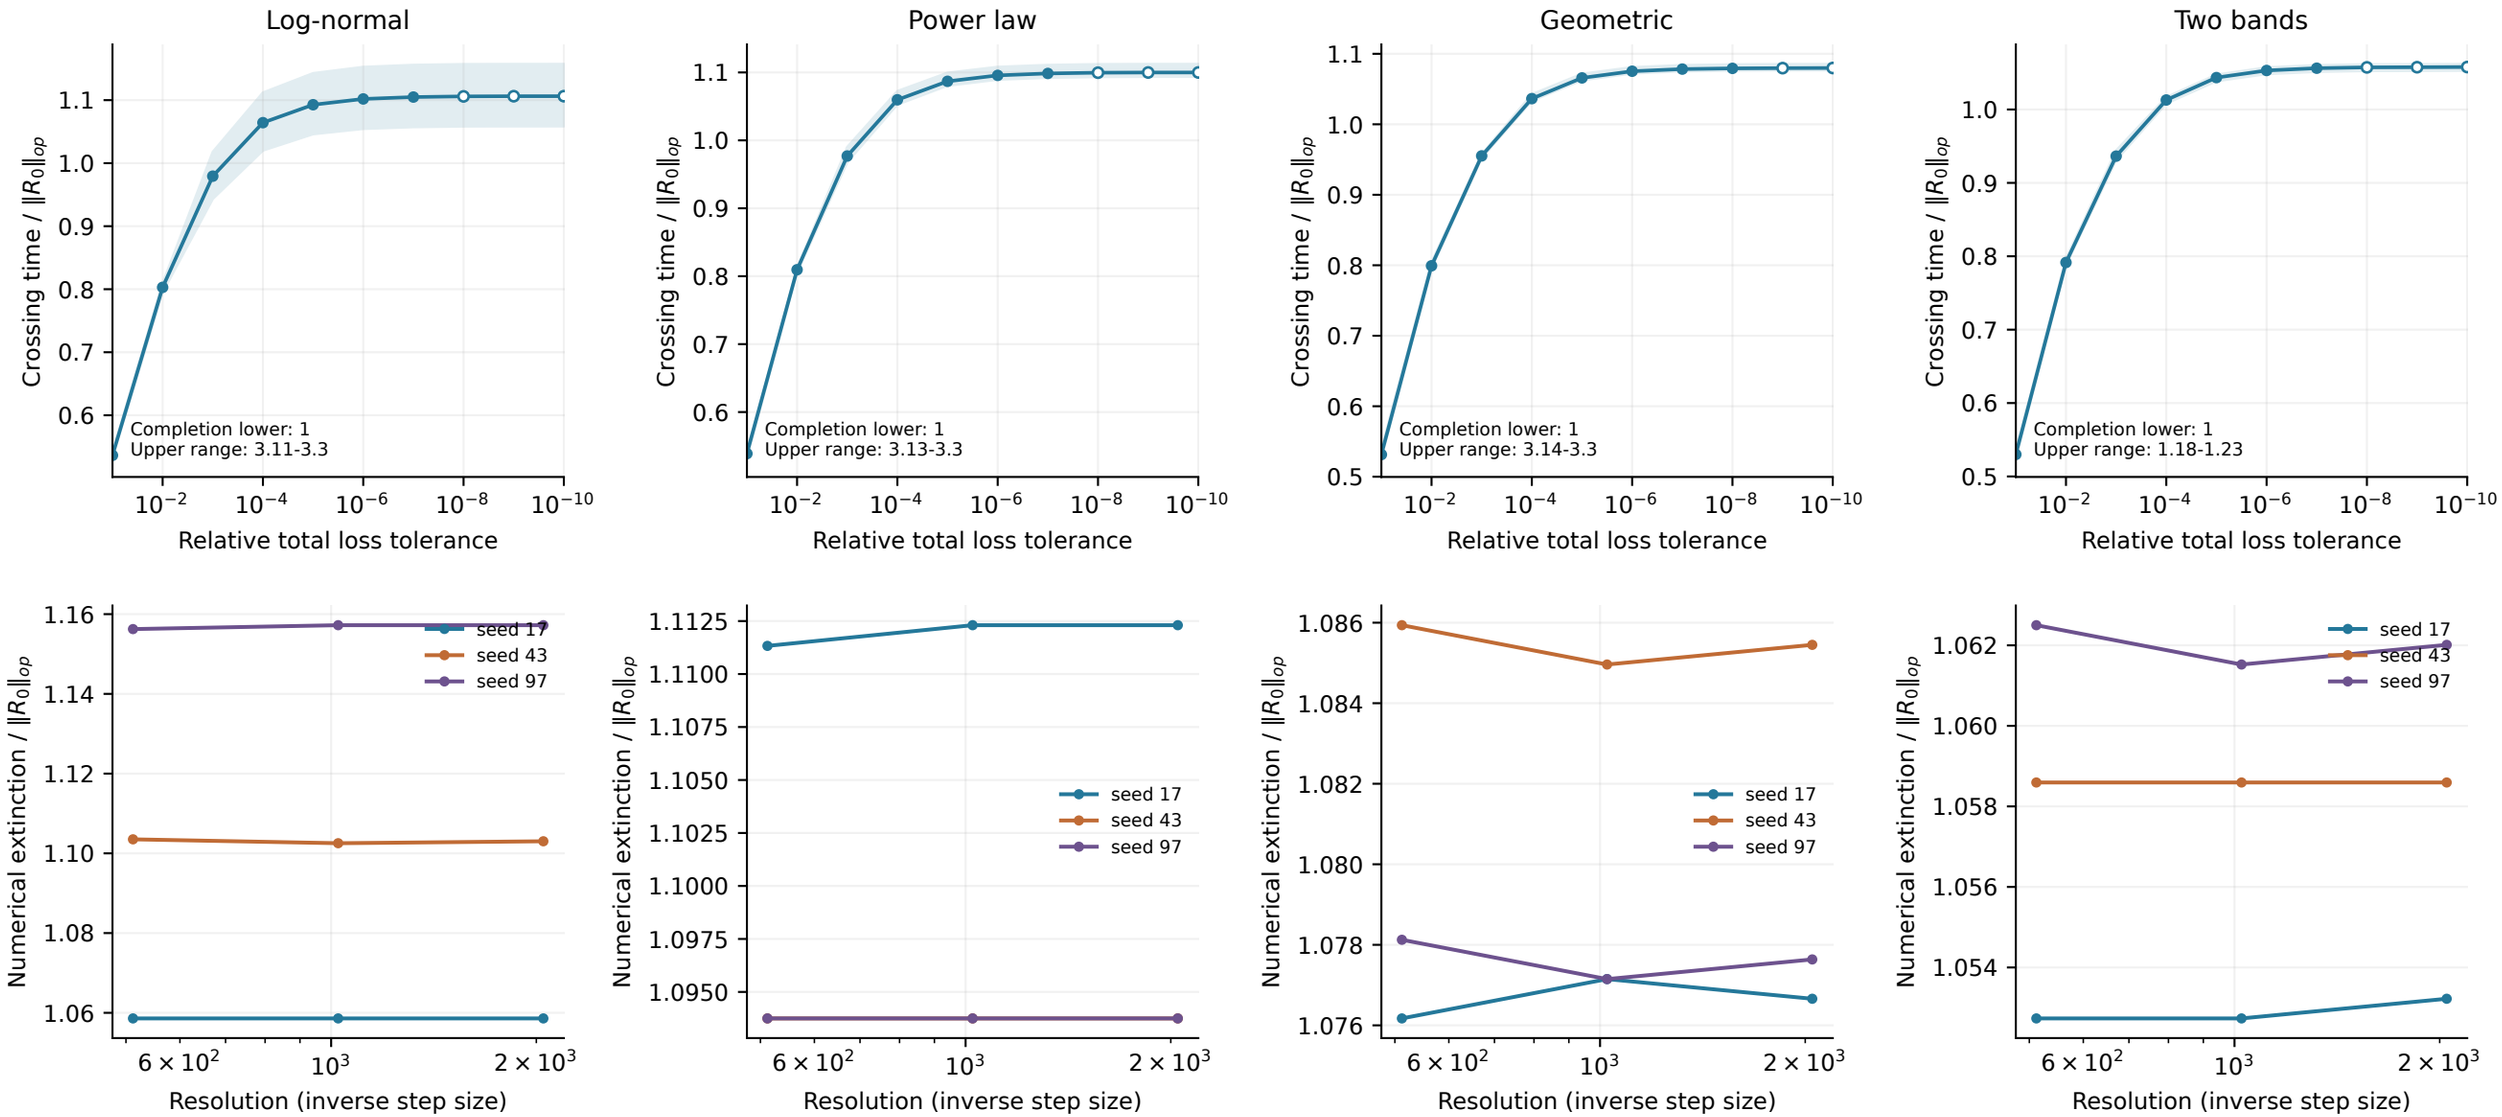
Completion estimates: decreasing loss tolerances and step refinement



Fixed: d=32, sigma=1, W0 scale=0.5; beta=a=1, h=ln(100), r=20, m=16. Top: seed mean/min-max.
Hollow points: at least one seed interpolates the last saved segment to zero; CSV gives per-case flags.
Bottom: every executed resolution for the fixed baselines. Numerical extinction is an approximation, not evidence of exact finite-time arrival.
