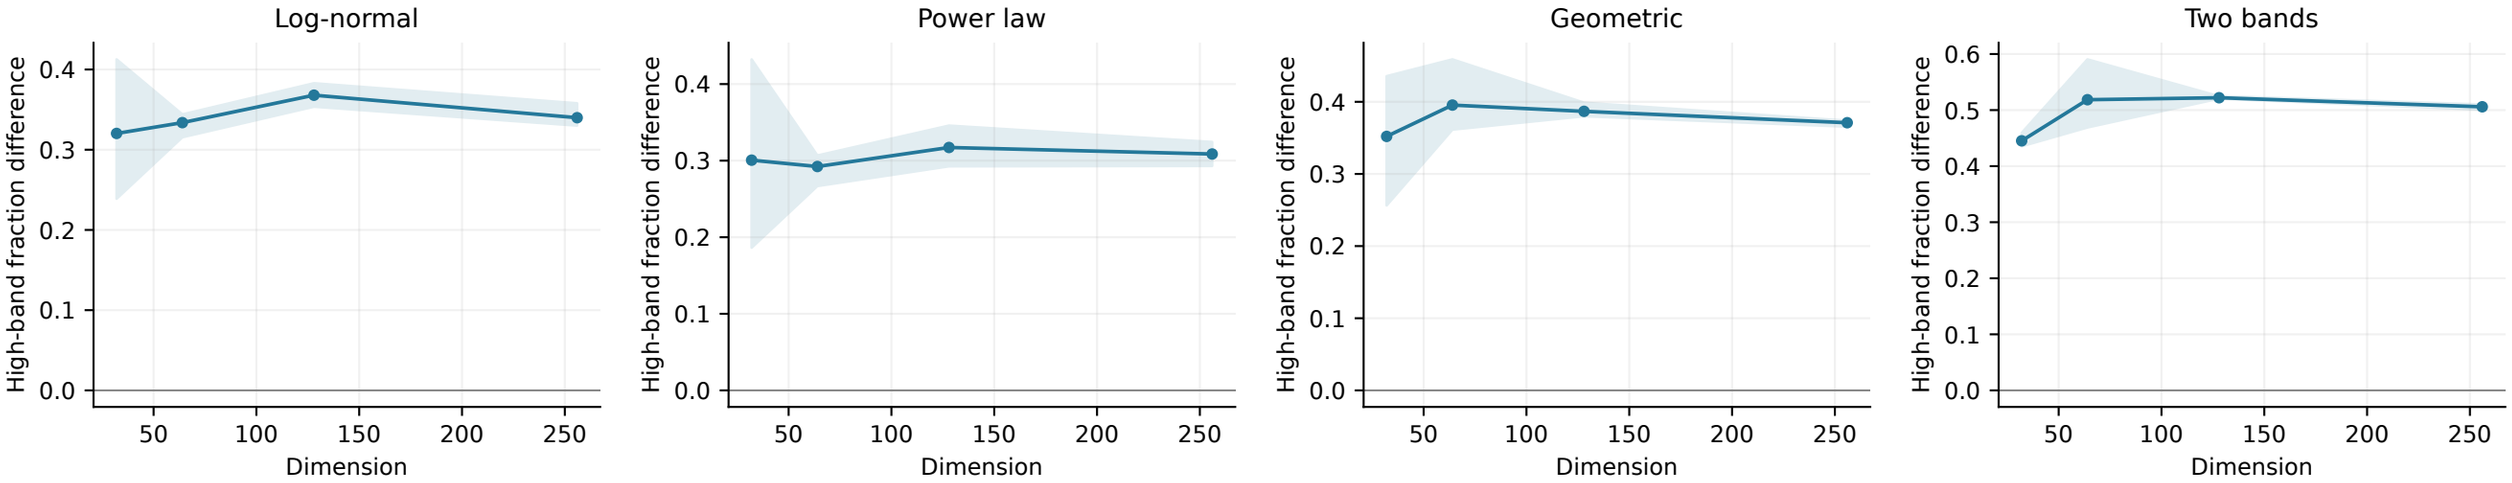
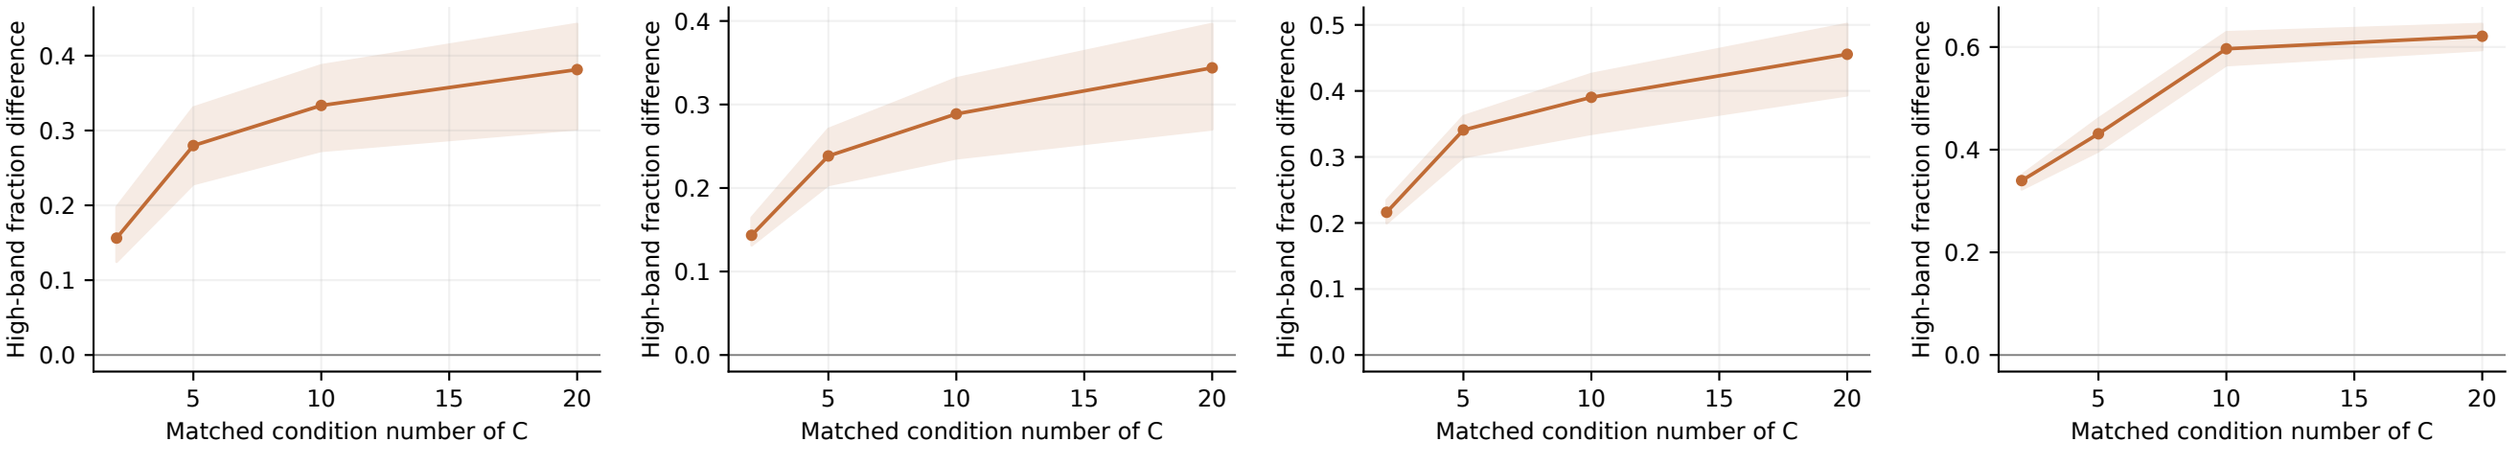
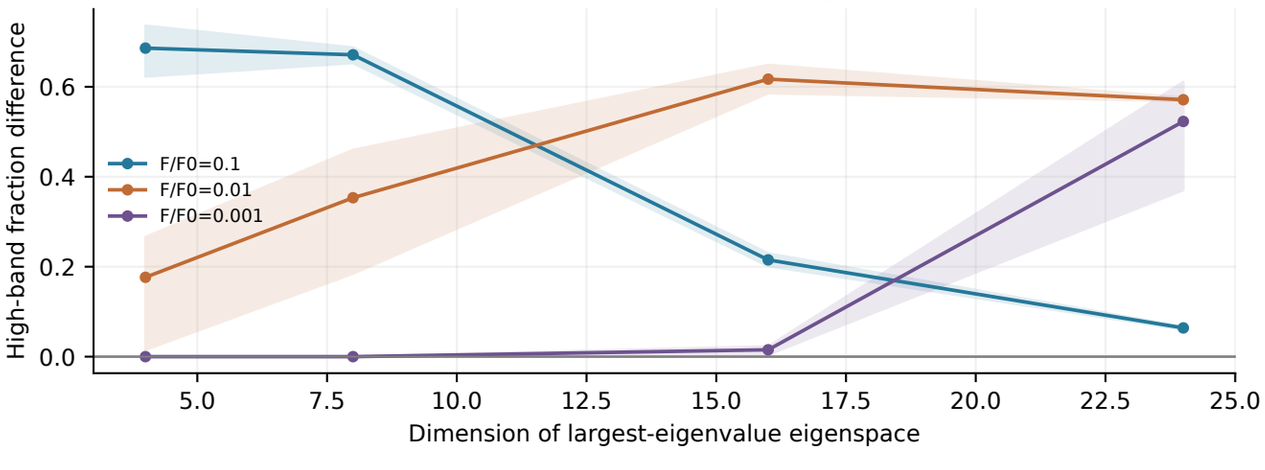
Dimension, matched conditioning, and eigenspace multiplicity







Dimension row: sigma=1, W0 scale=0.5; baseline shapes.
Conditioning row: d=32, sigma=0.3, W0 scale=0.5.
Multiplicity: d=32, sigma=0.3, r=20, W0 scale=0.5.
Baseline shapes: beta=a=1, h=ln(100), r=20.

Bands: full top eigenspace for two-band spectra;
median cutoff retaining ties otherwise.
Lines/shading: seed mean/min-max, not confidence intervals.

F/F0=0.01 in upper two rows. d=32 baseline is shown with the dimension sweep; the remaining dimension settings are independently paired runs.
Plotted means include unresolved points. All settings and five checkpoints, with numerical-resolution labels, are in grouped_allocation.csv.
